*Joint Math Meeting, Baltimore, MD, January 15*

# What are HMMs?

A Hidden Markov model (HMM) is a stochastic signal model which has three assumptions:

- The observation at time  $t$ ,  $O_t$ , was generated by some process whose state,  $S_t$ , is **hidden**.
- The hidden process satisfies the first-order Markov property: given  $S_{t-1}$ ,  $S_t$  is independent of  $S_i$  for any  $i < t - 1$ .
- The hidden state variable is discrete.

# History of HMMs

- Introduced in 1966 by Baum and Petrie
- Baum and his colleagues published HMM training for a single observation, 1970
- Levonson, Rabiner, and Sondhi presented HMM training for multiple independent observations, 1983
- Li, Parizeau, and Plamondo introduced HMM training for multiple observations, 2000

# Some applications of HMMs

Figure : 1. Speech recognition 2. Bioinformatics 3. Finance

# Elements of HMM

- Observation data,  $O = (O_t), t = 1, \dots, T$
- Hidden states,  $S = (S_i), i = 1, 2, \dots, N$
- Hidden state sequence:  $Q = (q_t), t = 1, \dots, T$
- Transition matrix  $A$

$$a_{ij} = P(q_t = S_j | q_{t-1} = S_i), i, j = 1, 2, \dots, N$$

- Observation symbols per state,  $V = (v_k), k = 1, 2, \dots, M$
- The observation probability

$$B : b_i(k) = P(O_t = v_k | q_t = S_i), i = 1, 2, \dots, N; k = 1, 2, \dots, M$$

- Initial probabilities, vector  $p$ , of being in state  $S_i$  at  $t = 1$

$$p_i = P(q_1 = S_i), i = 1, 2, \dots, N$$

# Hidden Markov Model

Parameters of HMM:  $\lambda = \{A, B, p\}$

# Three problems and corresponding solutions for HMMs

- 1 Given  $(O, \lambda)$ , compute the probability of observations,  $P(O|\lambda)$

# Three problems and corresponding solutions for HMMs

- 1 Given  $(O, \lambda)$ , compute the probability of observations,  $P(O|\lambda)$

**Forward, backward algorithm**

# Three problems and corresponding solutions for HMMs

- 1 Given  $(O, \lambda)$ , compute the probability of observations,  $P(O|\lambda)$

**Forward, backward algorithm**

- 2 Given  $(O, \lambda)$ , simulate the most likely hidden states,  $Q$

# Three problems and corresponding solutions for HMMs

- 1 Given  $(O, \lambda)$ , compute the probability of observations,  $P(O|\lambda)$

**Forward, backward algorithm**

- 2 Given  $(O, \lambda)$ , simulate the most likely hidden states,  $Q$

**Viterbi algorithm**

# Three problems and corresponding solutions for HMMs

- 1 Given  $(O, \lambda)$ , compute the probability of observations,  $P(O|\lambda)$

**Forward, backward algorithm**

- 2 Given  $(O, \lambda)$ , simulate the most likely hidden states,  $Q$

**Viterbi algorithm**

- 3 Given  $O$ , calibrate HMM parameters,  $\lambda$

# Three problems and corresponding solutions for HMMs

- 1 Given  $(O, \lambda)$ , compute the probability of observations,  $P(O|\lambda)$

**Forward, backward algorithm**

- 2 Given  $(O, \lambda)$ , simulate the most likely hidden states,  $Q$

**Viterbi algorithm**

- 3 Given  $O$ , calibrate HMM parameters,  $\lambda$

**Baum-Welch algorithm**

# Forward Algorithm

Define the joint probability  $\alpha_t(i) = P(O_1, O_2, \dots, O_t, q_t = S_i | \lambda)$

# Forward algorithm

- Initialization,  $\alpha_1(i) = p_i b_i(O_1)$  for  $i = 1, \dots, N$
- For  $t = 2, 3, \dots, T$ , for  $j = 1, \dots, N$

$$\alpha_t(j) = \left[ \sum_{i=1}^N \alpha_{t-1}(i) a_{ij} \right] b_j(O_t),$$

- $P(O|\lambda) = \sum_{i=1}^N \alpha_T(i)$

# Backward Algorithm

Define the conditional probability

$$\beta_t(j) = P(O_{t+1}, O_{t+2}, \dots, O_T | q_t = S_j, \lambda), \text{ for } j = 1, \dots, N$$

# Backward Algorithm

## Algorithm

- Initialization,  $\beta_T(i) = 1$  for  $i = 1, \dots, N$
- For  $t = T - 1, T - 2, \dots, 1$ , for  $i = 1, \dots, N$

$$\beta_t(i) = \sum_{j=1}^N a_{ij} b_j(O_{t+1}) \beta_{t+1}(j)$$

- $P(O|\lambda) = \sum_{i=1}^N p_i b_i(O_1) \beta_1(i)$

# Choose economics indicators

- 1 Inflation (CPI)
- 2 Credit Index
- 3 Yield Curve
- 4 Commodity
- 5 Dow Jones Industrial Average

# Training and Predicting Process

Using the variables above:

- Use HMM for single and multiple observation data with normal distributions.
- Calibrate Markov-switching model parameters using Baum-Welch algorithm
- Define state or regime 2 with lower *mean/variance*
- Use the obtained parameters to predict the corresponding states (regimes), predict the upcoming regime.

# Results

**Figure :** Dow Jones observations vs probabilities of being in the bear market

# Results

Figure : Forecast bear market using CPI indicator

# Results

Figure : Forecast bear market using multiple observations

- *S&P* 500, a stock market index based on the market capitalizations of 500 large companies having common stock listed on the NYSE or NASDAQ. Monthly percentage changes from February 1947 through June 2013.
- SPY
- GOOG
- FORD
- AAPL
- GE

# Training and Predicting Process

Using the variables above:

- Use HMM for single and multiple observation data with normal distributions.
- Calibrate Markov-switching model parameters using Baum-Welch algorithm
- Use the obtained parameters to predict stock prices for the next trading period.

Figure : Forecast *S&P500* close prices using single observation

# Results

**Figure :** Forecast *S&P500* closing prices using multiple observations (open-close-high-low)

# Results

Figure : Forecast *SPY* bid price in tick by tick

# Can we use HMMs to make money?

Symbol	Initial Investment (\$)	Earning (\$)	Earning %
SPY	9,000.00	2050.66	22.79
GOOG	30,000.00	29,036.4	96.79
FORD	250.00	10.10	4.04
AAPL	950.00	19.06	2.01
GE	1,700.00	490.00	28.82
TOTAL	41,900.00	31,606.22	75.43

**Table :** One year daily stock trading portfolio from December 2012 to December 2013

# Thank you!
